

interactive music mapping vienna

networks in space and time

velitchko filipov

velitchko.filipov@tuwien.ac.at

scope - what to expect

interdisciplinary project interactive music mapping vienna (immv)

based on: *“gone full circle: a radial approach to visualize event-based networks in digital humanities”* [filipov et al. 2021]

collaboration between musicologists, historians, and computer scientists

context, results, and experience

ongoing research

definitions

visual analytics (va): “.. *the science of analytical reasoning facilitated by interactive visual interfaces.*” [**illuminating the path, thomas & cook, 2005**]

network visualization (netvis): is an abstract way of representing data as objects (nodes) and relationships (links), and can be used to model and visualize problems in a wide range of application domains.

digital humanities (dh): is an area of scholarly activity at the intersection of computing or digital technologies and the disciplines of the humanities.

networks in the humanities

research questions and methods stem from a different epistemological standing
[hinrichs et al. 2017]

modelling data for historical research is challenging [börner et al., 2019]

data is rich and interpretable with many different and complex characteristics
[lamqaddam et al. 2018]

networks are flexible and can model such structures to represent the intricacies
and complexity of this type of data [lincoln, 2016; schetinger et al. 2019]

examples of networks in the humanities

1580–1590

1640–1650

problem description

paradigm shift in the way time is represented [**simonetto et al., 2020**]

from time slices and temporal aggregation to event-based data

limits of complexity [**yoghourdjian et al., 2018**]

visual scalability concerns with increasing network size and dynamics

simplicity, aesthetics & engagement [**borkin et al., 2013**]

radial visualizations [**draper et al., 2009**]

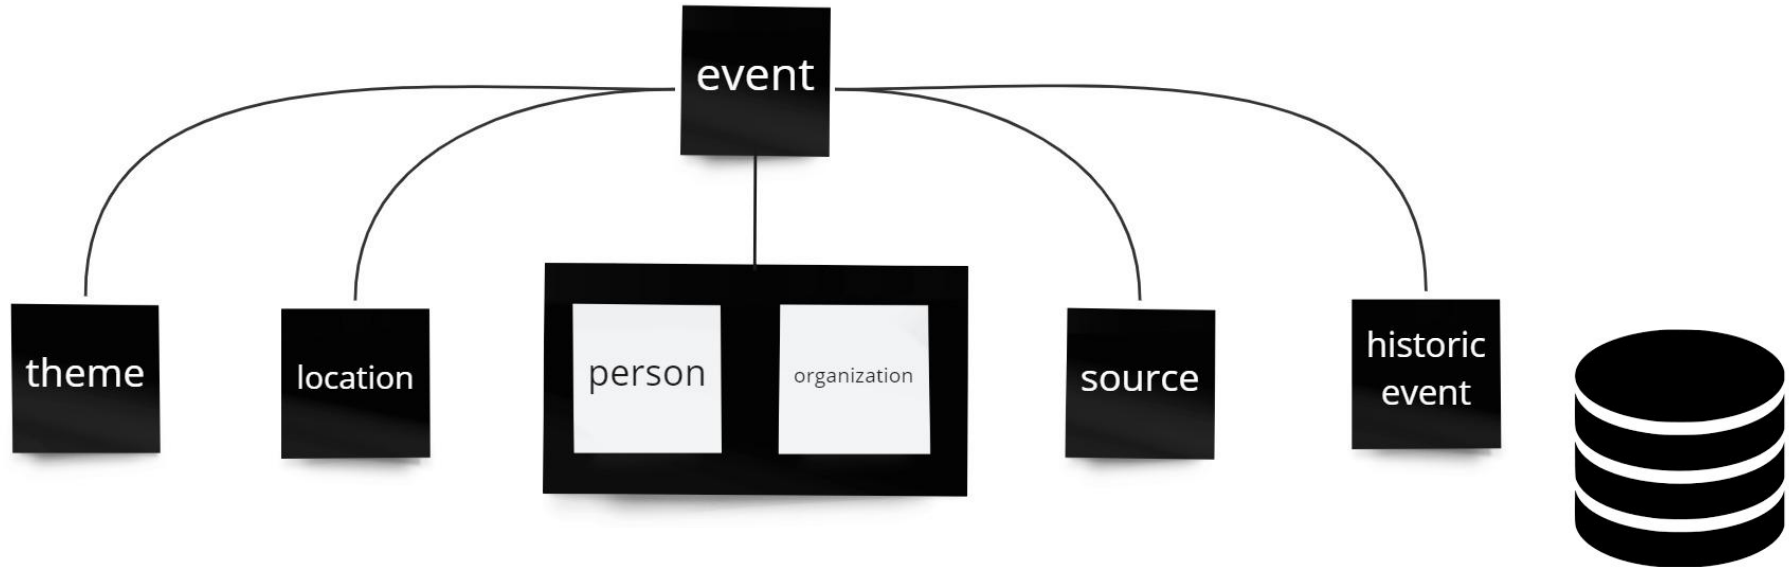

novel network metaphors [**beck et al., 2017**]

problem description: data

network relating disparate entities in spatial and temporal contexts

six different types of entities with events at the center

problem description: users

aimed at humanities experts with domain knowledge

to support **exploring historical narratives** on the basis of events

to engage with **discovering and interacting** with viennese musical history

problem description: tasks

goal: support a variety of tasks ranging from high-level to low-level [**brehmer & munzner, 2013**]

present: a straightforward, aesthetic, and engaging interface to gain an overview of the event-based network

compare: entities or groups of entities that exhibit similar characteristics to observe their development over time

explore: navigate the network and dive into more details

identify: (dis-)continuities of themes and historical developments

verify: validate the data

evaluation/feedback

domain and **visualization experts** participating in a study

interesting approach to explore linked historical data

radial component was considered **aesthetically** pleasing, **compact**, and interesting

interactions **engaged** the participants and enabled to explore more details and new information

participants kept exploring some interesting parts even after concluding the study

limitations

learning curve required explaining of the encoding and interactions

no guidance to point / suggest interesting points in history

usability issues & feature requests

- navigating back and forth between different selections

- no ability to lock in the selection of the period of time

- some issues with hiding sections of the interface

ongoing/current research

networks in digital art history -- fwf project 'artvis' (P35767)

goal: better understanding of how the components of the art system (persons, objects, places, institutions, and events) interact with each other and how these interactions vary over time by leveraging *dynamic network visualization*

tu wien: silvia miksch, victor schetinger, velitchko filipov

uni wien: raphael rosenberg, teresa kamencek
